- 9" Pommel on Jr & Sr
- Chest Pad - Small

Proven Therapeutic Value

The *fci walker, or gait trainer*, is a hands-free device that encourages upright mobility and promotes independence. The user's upright position, with a slight forward lean, encourages and stimulates forward stepping. This device can be used in two distinct ways: users can face forward for upper extremity and/or trunk support while using the attached tray as a surface for other activities or meals when stationary. Alternatively, users can face backwards to achieve closer access to involved play – to kick a ball or to simply better explore their environment.

CREATING A CYCLE OF *mobility*[™]
Since 1991

– *fci walker mini*

The frame height, pommel height, chest pad height, and tray heights are each individually adjustable. The posterior support component can be removed to facilitate transferring the child in or out of the walker. The chest support of the walker can also be adjusted to change the angle of body (trunk) to a more forward prone position if either more support is needed and/or to facilitate forward movement such as stepping.

– *fci walker senior*

– *fci walker junior*

OPTIONAL FEATURES:

- 5" Castors (3" standard)
- Wheel Locks (brakes)
- Variety of Directionals Available
- High Back, custom made to the dimensions supplied. High backs are typically three-sided and extend to the shoulders or to the top of the user's head.
